The introduction to physics you get in this site will explain laws and

principles that are accepted as of today. Physics is a progressive science as scientists change their mind all the time, so don't be shock when a change is made. it is a good thing when they change their minds and find a better solution to explain our physical world.

But physics is the foundation for all of the other sciences. When we think about chemistry, when we think about chemistry, which is at the end of the day interactions between atoms, those interactions are really physics-based interactions. So chemistry, chemistry is actually laid down on a foundation of physics.

Physics is the branch of science which deals with matter and its relation to energy. It involves study of physical and natural phenomena around us. Examples of these phenomena are formation of rainbow, occurrence eclipse, the fall of things from up to down, the cause of sunset and sunrise, formation of shadow and

This chapter defines an important area of physics we call the physics of nanoscale electronics. The core concepts of non-equilibrium, size effects and neighboring perturbation are introduced and a quick run through the emerging topics including metal spintronics, semiconductor spintronics, single electronics and quantum dot, molecular electronics, carbon nanotube transistors and graphene electronics is provided.
